

Heaven-LLB -- Heaven by Los Lonely Boys

Los Lonely Boys, self-titled debut, 2003. ~76 BPM, est.

JoJo Garza's bass sits warm and round under the Tejano-soul groove -- supportive, never flashy, with a soulful lift when the chorus opens up.

GP-5 only, Sire fretless (Passive), no pedalboard.

Instrument: Sire V7 fretless, Passive

Passive over active here -- the warmer, rounder passive voicing suits the soul/Tejano ballad character better than the more hi-fi active output. Same call made on Tennessee Whiskey and 1234 for the same reason.

IR: Apg115 (Ampeg Heritage B-15), Slot 1

Paired with AMP: Classic Bass (Ampeg SVT) per the suggested pairing in `IRs/ir.md`. The B-15's 100Hz peak gives the girth this part needs without EQ tricks -- the Ampeg B-15/SVT family is a natural fit for warm, soulful, fingerstyle bass.

CAB = User IR 1, real active reference (confirmed slot), VOL 65.

Module chain

NR -- Gate, always on.

THRE: 20. Light touch -- passive fretless into a clean amp doesn't generate much noise, just enough gating to keep things tight between phrases.

PRE -- Micro Boost, on CTL.

Gain: 35 when engaged.

Off for the verse, on for the chorus -- same clean tone, just pushed a little harder into the front end for the emotional lift.

DST -- off. No drive anywhere. This is a warm, clean soul-bass tone start to finish.

AMP -- Classic Bass (Ampeg SVT), always on.

Gain: 35 -- clean headroom, just enough amp character to feel alive, not driven.

Bass: 65 -- the low end that gives the part its weight.

Middle: 55, MidFreq: 450Hz -- a touch of midrange presence so the fretless line doesn't disappear under the guitars.

Treble: 45 -- rolled back slightly, keeps the tone warm rather than clanky (fretless strings can get zingy if left too bright).

VOL: 70.

CAB -- User IR 1 (Apg115), always on.

VOL: 65.

EQ -- Bass EQ 2, always on.

50Hz: +3, 120Hz: +2, 400Hz: -2, 800Hz: 0, 4.5kHz: +2, VOL: 55.

Small reinforcement at the bottom for weight, a light scoop around 400Hz to avoid boxiness, and a touch of top-end lift at 4.5kHz so fretless finger noise and note definition still read clearly.

MOD -- off. No chorus/vibe -- the fretless glide and the warm IR/amp pairing already carry the character; stacking modulation would blur the pitch definition this part needs.

DLY -- off. Straight, supportive part. No delay.

RVB -- Hall, on CTL.

Mix: 30, Decay: 45, Trail: true.

Off for the verse -- close and dry, right on the groove.

On for the chorus, alongside the boost -- opens the space up for the song's emotional swell without drowning the low end.

CTL footswitch

Two modules on CTL: PRE (Micro Boost) and RVB (Hall).

- **CTL off** -- verse groove. Warm, clean, close, restrained. Resting state the patch loads into.
- **CTL on** -- chorus lift. Boosted front end plus hall reverb, same amp/cab tone underneath, bigger and more emotional without changing character.

Engage CTL going into each chorus, back off for the verses.
